

# Student critique of AI interpretations

---

TODO(HUMAN): replace this entire template with your own 200–300-word critique. Do not submit the text below as personal work.

Use these evidence-backed prompts while writing:

- Which AI partitions were useful, and which were repetitive or based on unstated validation policy?
- The raw results are login 90/20 failed, checkout 91/26 failed, and order status 86/4 failed. Verify these numbers in `newman/results/*.json` before citing them.
- Explain why many assertion failures represent a small number of root causes rather than 50 independent bugs.
- Discuss one corrected INVALID case and one INCOMPLETE case from the workbook.
- Explain why state setup and role authorization had to be checked against the real route, not only the API document.
- Explain how your five cases per API differ from AI-origin cases and why the AI missed them.
- State which AI recommendation you rejected or changed and why.

Suggested structure (delete after writing):

1. 60–80 words on strengths.
2. 80–120 words on errors/omissions, with case IDs and raw metrics.
3. 60–80 words on your corrections and final responsibility.

Final word count: TODO(HUMAN): 200–300
