

CI/CD report

Student ID: 23127065
Student Name: NGÔ NGUYỄN THẾ KHOA (Ngo Nguyen The Khoa)
Class: 23KTPM3
Course: CS423 / CSC13003 – Software Testing

Workflow: repository root `.github/workflows/hw06-api-tests.yml`.

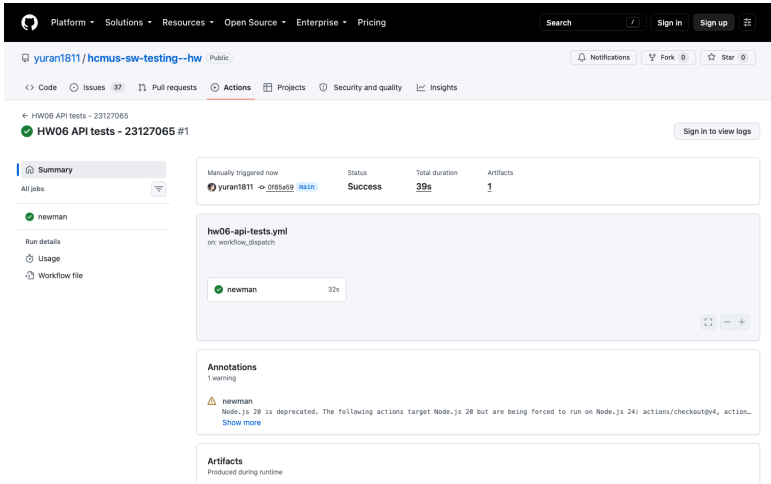

The manual workflow checks out this submission and the exact public SUT revision, installs Node 22 and pinned Newman dependencies, seeds SQLite, starts the backend, waits for `/api/products`, and runs Postman data through Newman. JUnit results are uploaded even when an assertion fails.

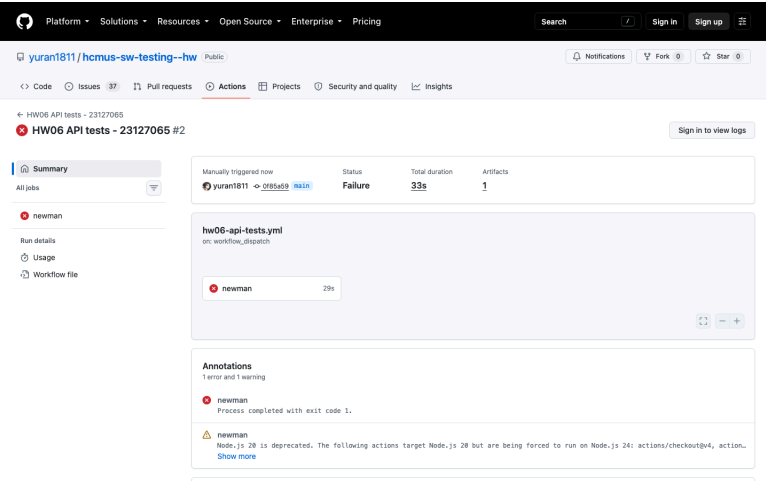

Two modes are provided:

- `pass`: runs one known-good case for each of the three API folders. Expected result: green workflow.
- `intentional-failure`: runs `CI-DEMO-FAIL-001`, which deliberately expects HTTP 418 from valid login. Expected result: red workflow with exactly one intentional assertion failure.

Local pre-publication verification on 2026-08-08 confirmed that `pass` produces three green samples (three assertions each) and `intentional-failure` exits 1 with exactly one failed assertion out of three. GitHub-hosted evidence is still required below.

Published GitHub Actions runs

Evidence	Commit	Run URL	Status	Screenshot
All-pass sample	0f85a59	#32390866536	Passed (Green )	

Evidence	Commit	Run URL	Status	Screenshot
One-failure sample	0f85a59	#32390874323	Failed (Red ✖)	

Both runs executed on GitHub Actions runners with live SQLite seed, API backend initialization, data-driven Newman executions, and JUnit artifact uploads.
